

EP19EOb – CULTURE OF SAFETY

INPATIENT NURSE SENSITIVE QUALITY INDICATORS: HAPI STAGE 2 AND ABOVE

Provide four nurse-sensitive clinical quality indicators for all eligible patient units. Data provided must reflect eight of the most recent consecutive and complete quarters of inpatient, unit-level graphed data to demonstrate outperformance of the benchmark provided by the vendor's national database.

Four (4) inpatient nurse-sensitive clinical quality indicators:

- a. Indicator #1 (required): Falls with injury*
- b. Indicator #2 (required): Hospital-acquired pressure injury (HAPI) stages 2 and above*

Select two other nurse-sensitive clinical quality indicators from this list:

- c. Assaults by psychiatric patients (inpatient psychiatric only)*
- d. Catheter-associated urinary tract infection (CAUTI)*
- e. Central line-associated blood stream infection (CLABSI)*
- f. Hospital-acquired Clostridium difficile (CDIFF)*
- g. Device-related HAPI*
- h. Multi-drug resistant organism (MDRO)*
- i. Peripheral intravenous infiltrations (PIV)*

NewYork-Presbyterian/Columbia University Irving Medical Center (NYP/Columbia) contributes nursing sensitive indicator (NSI) data for percent of surveyed patients with hospital-acquired pressure injuries stage 2 and above (HAPI stage 2 and above) from the eligible inpatient unit every quarter to the Press Ganey® National Database for Nursing Quality Indicators (NDNQI®).

Data are reported for the most current, consecutive, and complete eight calendar quarters for which a benchmark is available (3Q Calendar Year 2021 – 2Q Calendar Year 2023). All NYP/Columbia inpatient units are compared nationally to the NDNQI® Bed Size ≥ 500; Academic Medical Centers (BS-AMC) mean.

Unit-level outperformance data for HAPI stage 2 and above is summarized in the table below. The national benchmark used for comparison is reported in the table and on the graphs. Overall, 13 out of 23 eligible inpatient units outperformed the NDNQI® national level BS-AMC mean benchmark for HAPI stage 2 and above.
